 1.1 mA = FULL TORQUE

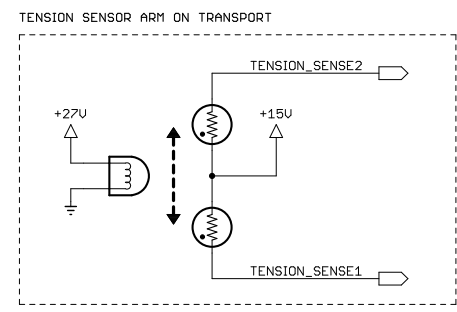

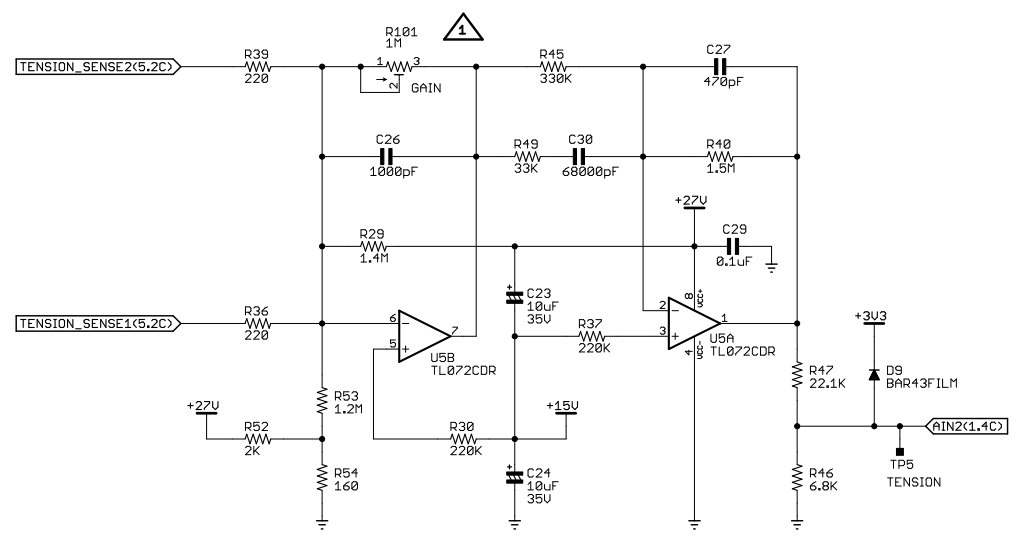

MOTOR DRIVE AMP CURRENT DAC

TENSION SENSOR PHOTOCELL AMP

NOTE, THE TLV5637 IS A 10-BIT VERSION OF THE TLV5626.

PROGRAM INTERNAL REF TO 1.024V
 DAC OUTPUT RANGE IS 2X THE REF
 OUTPUT WILL GO FROM 0V TO 2.048V

ADJUST TRIMMER R85 FOR MID SCALE DAC READING OF XXXX WITH NO PRESSURE ON THE TENSION SENSOR ARM.

When the DAC outputs 205U (the max value for code 255), U12A-3 should be 0.387U.
 When the DAC outputs 0U (the value for code 0), U12A-3 should be 0.123U.
 The math problem is 2 equations in 2 unknowns. The method I used is plain-old DC circuit analysis, sum of currents at U12A-3 = 0:

#1
 Sum of currents through Rpu and R53 into node at U12A-2 = Current out of node U12A-2 through R55 to 0V.
 $(3.3V - 0.387U) / Rpu + (2.05U - 0.387U) / R53 = 0.387U / 1K$

#2
 Current through Rpu into node at U12A-2 = sum of currents out of node U12A-2 through R53 and R31 to 0V.
 $(3.3V - 0.123U) / Rpu = 0.123U / R53 + 0.123U / 1K$

Rearrange both equations to isolate Rpu:

#1b
 $Rpu = 3.177 / [0.000123 + (0.123 / R53)]$

#2b
 $Rpu = 2.913 / [0.000387 - (1.663 / R53)]$

Now, the right sides of the 2 equations are equal to each other, since they're both = Rpu. Solve for R53 and you get 5.65K.
 Then, plug 5.65K into 1b and Rpu = 21.947K.
 Since we use standard values 22K & 5.6K, the DAC range 0 - 255 will give you a little more than 0.123U to 0.387U, but it will be very close.
 This will result in a DAC range of about 5 - 250, or about 0.4% steps.

REQUIRED WIRING MODIFICATIONS TO THE MM1200

1 THE SEARCH-TO-CUE/COUNTER CARD GENERATES TACH PULSES ON J4 PIN-22. THESE PULSES ARE DERIVED FROM THE TAPE ROLLER/COUNTER QUADRATURE ENCODER TO PROVIDE TAPE SPEED FEEDBACK. THESE TACH PULSES MUST BE ROUTED TO J1 PIN-Y ON THE NEW TRANSPORT CONTROLLER CARD FOR PROPER PLAY MODE OPERATION.

THIS REQUIRES REMOVING THE CONTROL ELECTRONICS CARD CAGE FROM THE MM1200 AND ADDING A JUMPER WIRE FROM EDGE CONNECTOR J4 PIN-22 (STC/COUNTER CARD) AND RUNNING A WIRE OVER TO EDGE CONNECTOR J1 PIN-Y (TRANSPORT CTL CARD) ON THE CARD CAGE CONNECTORS.

NOTE THAT THERE IS ALREADY A WIRE ON J4 PIN-22 WHICH FEEDS THE TACH OUTPUT TO J13 ACCESSORY CONNECTOR PIN AA. THIS WIRE SHOULD REMAIN AND THE JUMPER WIRE SHOULD CONNECT TO THIS SAME WIRE ON PIN-22 OF J4. THEN, ROUTE THE NEW WIRE FROM HERE TO J1 PIN-Y ON THE TRANSPORT CONTROL CARD SLOT. NOW THE TACH PULSES WILL BE AVIALABLE ON J1 PIN-Y FOR THE DTC-1200.

2 THE 5V POWER FOR THE TRANSPORT CONTROL CARD SLOT COMES FROM THE CAPSTAN SERVO CARD IN THE ORIGINAL AMPEX DESIGN. THE ZENER REGULATOR ON THE CAPSTAN DOES NOT HAVE ENOUGH CURRENT CAPABILITY TO POWER THE NEW DTC-1200 DIGITAL TRANSPORT CONTROLLER CARD.

THEREFORE, J1 WIRING MUST BE CHANGED TO DRAW 5V POWER FROM THE MAIN SYSTEM 5V REGULATOR INSTEAD. THE MAIN SYSTEM +5V RAIL IS AVAILABLE AT J4 (SEARCH-TO-CUE) PINS 1/FF & A/28. THE NEW CONTROLLER CARD DRAWS ABOUT 220MA TOTAL CURRENT IN NORMAL OPERATION AND MUST NOW RUN FROM THE SYSTEM +5V RAIL.

DISCONNECT THE +5V OUTPUT WIRE FROM J2 (CAPSTAN SERVO CARD) PINS 4 & D AND MOVE THIS TO PINS FF & 28 ON J4 (SEARCH-TO-CUE CARD) INSTEAD. THIS WILL POWER THE NEW TRANSPORT CONTROLLER FROM THE MAIN SYSTEM 5V SUPPLY WITH 2A TOTAL MAX CURRENT.

3 JUMPERS WIRES ARE REQUIRED FOR RS-232 COMMUNICATIONS BETWEEN THE STC-1200 CUE/TIMER CARD AND THE DTC-1200 TRANSPORT CONTROL CARD ON EDGE CONNECTOR PINS F & H OF BOTH CARDS.

JUMPER A WIRE BETWEEN J1 PIN-F (TRANSPORT CTRL CARD) TO J4 PIN-F (STC/COUNTER CARD). ADDITIONALLY, JUMPER A WIRE BETWEEN J1 PIN-H TO J4 PIN-H.
